

Flutter Study JAM

Flutter uses Dart

Strongly typed language (**statically typed**)

Object-oriented language

→ Developed by Google

During app development

- JIT (**Just In Time**) Compilation
 - Faster compilation time during development
 - Faster app reload

When app is released (ready to launch in market)

- AOT (**Ahead Of Time**) Compilation
 - While running apps on device it is much faster

For developers, JIT helps in faster app development

For app users, AOT helps in faster app execution

Flutter is Different

Faster development and execution due to **JIT** and **AOT**

Similar user-ex compared to Native apps like Android and iOS

Single code base

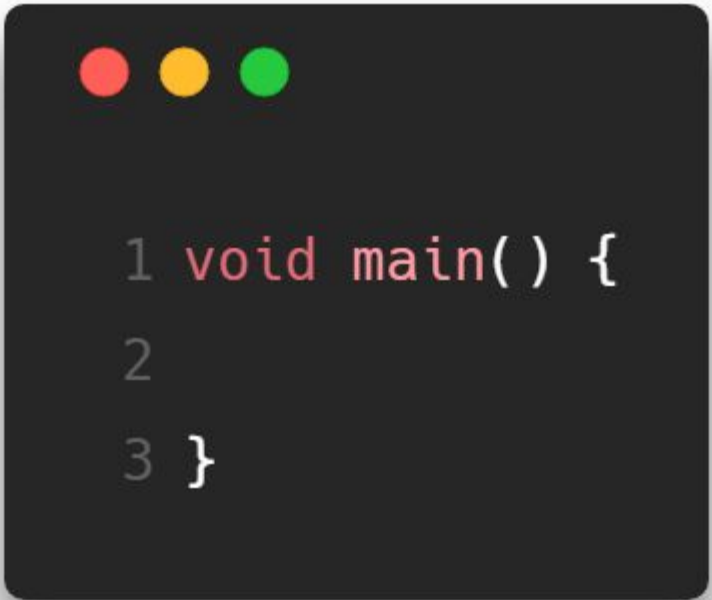

- Android
- iOS

You do not need any other declarative layout language like XML in Android, to create layouts in Flutter

Dart Codelab

<https://bit.ly/dart-lab>

- Dart files should have **.dart** extensions
- Every program starts with a **main** function. Entry point to your Dart application.

```
1 void main() {  
2  
3 }
```

Print to console

```
1 void main() {  
2     print("Welcome to DART!");  
3 }
```

Data Type : Numbers

```
1 void main() {  
2     int a = 7;  
3     double b = 3.5;  
4  
5     print('$a $b');  
6 }
```

```
1 void main() {  
2     int a = 7;  
3     double b = 3.5;  
4     num c = 45;  
5     num d = 4.5;  
6  
7     print('$c $d');  
8 }
```

Datatype: Strings

```
1 void main() {  
2     String str = "Dart";  
3  
4     print('I am learning the $str lang');  
5 }
```

Datatype: Booleans

```
1 void main() {  
2     bool flag = true;  
3  
4     print(flag);  
5 }
```

```
1 void main() {  
2     bool flag = false;  
3  
4     print(flag);  
5 }
```

```
1 void main() {  
2   var x = "Dart";  
3   print(x.runtimeType);  
4   var y = 4.5;  
5   print(y.runtimeType);  
6 }
```

var is a keyword that can declare any data type

runtimeType prints the type of the variable declared

```
1 // CONVERT ONE DATATYPE TO ANOTHER
2
3 void main() {
4     var x = "4";
5     int number = int.parse(x); // STRING TO INT
6
7     var y = "4.6";
8     double dNum = double.parse(y); // STRING TO DOUBLE
9
10    var z = 55;
11    String s = z.toString(); // INT TO STRING
12 }
```

```
1 // LISTS IN DART
```

```
2
```

```
3 void main() {
```

```
4   var a = [1, 2, 3];
```

```
5   var b = ["hello", "world"];
```

```
6   var c = [1, "abc", 4.3];
```

```
7 }
```

```
1 // MAPS IN DART
2
3 void main() {
4
5     var maps = {
6         "name": "John",
7         "age": 45
8     };
9
10 }
```

```
1 // MAPS PRINTING
2
3     print(maps);
4     print(maps.keys);
5     print(maps.values);
6     print(maps['name']);
```

```
1 void main() {  
2     final int x = 45;  
3     x = 35;  
4 }
```

5

6 *// Throws Error*

7 *// x, a final variable can only be set once*

```
1 // FUNCTIONS
2
3 void main() {
4     int res = getResult(5); // CALLING getResult FUNCTION
5     print(res);
6 }
7
8 int getResult(int x){ // getResult FUNCTION with returnType of int
9     return x*x;
10 }
```

```
1 // FUNCTIONS
2
3 void main() {
4     var groceryList = ["Apples", "Oranges"];
5     printGrocery(groceryList);
6 }
7
8 void printGrocery(List<String> list){ // TAKES PARAMETER OF LIST OF STRINGS
9     for(var item in list){
10         print(item);
11     }
12 }
```

```
1 // FUNCTIONS WITH OPTIONAL PARAMETERS
2
3 void main() {
4     var groceryList = ["Apples", "Oranges"];
5     printGrocery(groceryList);
6 }
7
8 void printGrocery(List<String> list, [double price]){
9     for(var item in list){
10         print(item);
11     }
12     print(price);
13 }
```

```
1 // NULL CHECK
2
3 if(price==null)
4     print("Free");
5 else
6     print(price);
```

```

1 // STRING INTERPOLATION
```

```
2
```

```
3     print('Price is ${price??"Free"}');
```

```
4
```

```
5
```

```
1 // CONSTRUCTING CLASSES
2
3 void main() {
4     Person pObj = new Person(name: "Rahul", age: 5); // pObj IS AN OBJECT
5     print(pObj.name); // PRINTING NAME
6 }
7
8 class Person{
9     String name;
10    int age;
11
12    Person({this.name, this.age}); // NAMED CONSTRUCTOR METHOD
13 }
```

```
1 // FAT ARROW FUNCTIONS
```

```
2 void printName() {
```

```
3     print(name);
```

```
4 }
```

```
5
```

```
6 // CAN BE WRITTEN AS
```

```
7 void printName => print(Name);
```

```
1 // STATIC MEMBERS
2 void main() {
3     print(Constants.ID); // CALLING STATIC CLASS VARIABLE
4     print(Constants.getID()); // CALLING STATIC CLASS METHOD
5 }
6
7 class Constants{
8     static String ID = "3353DJFHJD";
9     static String getID(){
10         return 'ID is $ID';
11     }
12 }
```
